Summary

Final-year Cybersecurity student with hands-on experience in Automotive Cybersecurity, Web pentest, Linux networking, and AI-powered security solutions. Experienced in Python development, firewall technologies, SIEM, and backend services through projects. Passionate about AI Security, SOC operations, and intelligent threat detection.

Education

Duy Tan University, Cyber Security – Da Nang, Vietnam

Experience

Automotive Cybersecurity Intern, LG Electronics R&D Vietnam (LG DUT Cyber Security Lab) July 2026 – Aug 2026

Topic: Linux, webOS, Python, Scapy, iptables, ip6tables, nftables, Docker

- Developed and validated Linux-based automotive cybersecurity solutions on webOS.
- Built Python (Scapy) tools for packet generation and firewall validation.
- Configured and tested firewall, IPv4/IPv6, VLAN, unicast, multicast, and packet analysis.

Cybersecurity Research Intern, Fore-Z Sept 2024 – Sept 2025

Tech Stack: WordPress, PHP, Burp Suite

- Reviewed WordPress plugin source code to identify security vulnerabilities.
- Performed manual vulnerability assessments and documented remediation reports.

Projects

AI-Powered Alert Prioritization Platform – <https://github.com/zewolkt3939/-AI-Powered-Alert-Prioritization-for-Wazuh-> Aug 2025 – Dec 2025

Backend & DevOps Engineer

- Developed Python FastAPI services to automatically collect, normalize, and process security events from Wazuh Indexer for centralized analysis.
- Built an AI-assisted alert prioritization module that classifies security events such as SQL Injection, XSS, Brute Force, LFI, and DoS attacks, reducing manual triage workload.
- Implemented event correlation logic to identify multi-stage attack patterns by analyzing source IPs, destination assets, and attack timelines across multiple log sources.
- Integrated automated Telegram notifications for high-severity incidents, enabling real-time alert delivery to analysts and reducing response time.

AI-Powered Malware Analysis Platform – <https://github.com/zewolkt3939/AI-Powered-Malware-Analysis-Platform/tree/main>

Technologies: Python, VirusTotal API

- Developed an AI-assisted malware analysis platform that combines static and dynamic analysis to automate malware detection and classification.
- Built Python-based feature extraction pipelines, integrated machine learning models for threat prediction, and collected sandbox analysis results to generate structured security reports.
- Implemented behavioral visualization and MITRE ATT&CK mapping to support security analysts during incident investigation.

Skills

Security: Wazuh SIEM, Elastic Stack, Suricata IDS/IPS, pfSense Firewall, Burp Suite, Wireshark, Nmap, Security Monitoring, Log Analysis, MITRE ATT&CK

Networking: TCP/IP, OSI Model, Routing & Switching, VLAN, Inter-VLAN Routing, STP, OSPF, ACL, NAT/PAT, DHCP, DNS, Subnetting, VLSM, DMZ Design, Network Segmentation

Programming: Python, SQL, Bash, Java, PHP, HTML, JavaScript

Artificial Intelligence: Prompt Engineering, Large Language Models (LLM), Transformers (Fundamentals), Pandas, NumPy

Backend & DevOps: FastAPI, REST API, Docker, Git, GitHub, Linux, VMware, AWS

Certifications & Training

- Google Cybersecurity Professional Certificate — Dec 2024
- Hack The Box Junior Cybersecurity Analyst Path — Completed
- Cisco Certified Network Associate (CCNA) — In Progress (80%)

Languages

English: English TOEIC 685 (B2)

Able to read technical documentation and communicate with teams.

Career Objective

Seeking a Security Engineer or AI Security Engineer role where I can apply expertise in Linux, networking, security automation, and AI-driven threat detection while continuously developing advanced skills in SOC operations, malware analysis, and embedded security.
